

### Client-Side vs. Server-Side

Client-Side is an important aspect because it deals with what the end user is experiencing. Anything from the font to the images the viewer sees. It creates an important visually appealing link to the user between the client-side and server-side.

Server-side makes the exchange of data on the client side possible. Whenever a user clicks something the server-side pulls up the proper information and the client-side displays it. The server-side is what manages the data and interacts with information.

Personally, I don't think one is more important than the other because both are needed to serve the end user properly. If one were just to have the basics and not focus on the client-side the user might not know where they need to click to get the proper information from the server-side. If the server-side doesn't work as well no matter what the client-side looks like the end user will be frustrated and not use the software.

The most important aspect when it comes to their interaction is that they are efficient in getting the job done properly. There are also other factors like speed that play an important role in keeping the user's attention.
