I think I found the most challenges when looking for solutions to creating content or figuring out where to start with items. Mostly due to a lot of code online either being incomplete or all over the place with its explanation. Usually I would just try different solutions until it looked like something might work if I tweaked a few things.

My other challenge was that the tutorial that I used was extremely outdated so a lot of it was broken and I had to troubleshoot things. This otherwise was a fun challenge and helped to better understand what the more important parts of the code were doing.

I think my greatest success was keeping at it and not giving up. If I needed to I usually worked on a different part of the project if I couldn't figure something out. I am proud that I got the Google log in to integrate in but unfortunately couldn't get Paypal to populate anything. It doesn't even appear to be redirecting at the moment.

Overall though I am happy with the end result because I didn't think I would get anywhere near where I did and I feel like I can read the code for ASP.NET a lot better than I previously could. I understand where certain things need to be put and I learned about other useful tools like how I would integrate other site logins along with things like site.master pages.
